## **SYLLABUS**

## 1. Data about the program of study

| 1.1 | Institution                    | The Technical University of Cluj-Napoca |
|-----|--------------------------------|---|
| 1.2 | Faculty                        | Faculty of Civil Engineering            |
| 1.3 | Department                     | Structural Mechanics                    |
| 1.4 | Field of study                 | Civil Engineering                       |
| 1.5 | Cycle of study                 | Bachelor of Science                     |
| 1.6 | Program of study/Qualification | CCIA English/Engineer                   |
| 1.7 | Form of education              | Full time                               |
| 1.8 | Subject code                   | 33.00                                   |

## 2. Data about the subject

| 2.1 | Subject name                   | Statics II   |                |      |                      |     |
|-----|--------------------------------|--|----------------|------|----------------------|-----|
| 2.2 | Subject area                   |  |                |      |                      |     |
| 2.3 | Course responsible/lecturer    | Prof. dr .ing. Mircea Petrina/Asist. ing.Moldovan Ilinca |                |      |                      |     |
| 2.4 | Teachers in charge of seminars | Asist. ing.Moldov  | an Ilinca      | 1    |                      |     |
| 2.5 | Year of study III 2.6 Semester | 1  | 2.7 Assessment | Exam | 2.8 Subject category | DID |

#### 3. Estimated total time

3.9

| 3.1 Ni   | umber of hours per week            | 5         | 3.2 of wh   | nich, course: | 3     | 3.3 applications: | 2  |
|--|------------------------------------|-----------|-------------|---------------|-------|-------------------|----|
| 3.4 To   | otal hours in the curriculum       | 70        | 3.5 of wh   | nich, course: | 42    | 3.6 applications: | 28 |
| Individual study   |                                    |           |             |               | hours |                   |    |
| Manu   | ual, lecture material and notes, b | ibliograp | ohy         |               |       |                   | 40 |
| Supp   | lementary study in the library, o  | nline and | d in the fi | eld           |       |                   | 12 |
| Preparation for seminars/laboratory works, homework, reports, portfolios, essays |                                    |           |             |               | 28    |                   |    |
| Tutoring   |                                    |           |             |               | 6     |                   |    |
| Exams and tests  |                                    |           |             |               | -     |                   |    |
| Other activities   |                                    |           |             |               | -     |                   |    |
| 3.7 Total hours of individual study 86   |                                    |           |             |               |       |                   |    |
| 3.8  | Total hours per semester           |           | 156         |               |       |                   |    |

## 4. **Pre-requisites (where appropriate)**

Number of credit points

| 4.1 | Curriculum | Courses of Mechanics I, Strength of Materials I, Statics I |
|-----|------------|--|
| 4.2 | Competence |  |

6

## 5. Requirements (where appropriate)

| 5.1 | For the course       | Amphitheater with blackboard           |
|-----|----------------------|--|
| 5.2 | For the applications | Classroom with blackboard, calculators |

## 6. Specific competences

| -            | 1           | <b>F</b>   |
|--------------|-------------|--|
|              |             | Theoretical knowledge:   |
|              |             | -applying building and design codes;   |
|              |             | -idealizing structures- simplified physical model of the structure and its supports as well as the   |
| _            | s           | applied loads;   |
| ona          | nce         | -establish the determinacy, indeterminacy, and stability of structures;                              |
| Professional | competences | -equations of static equilibrium and construction conditions;  |
| rofé         | duic        | -writing expressions for internal forces at any section in terms of external loads;                  |
| Ū.           | ö           | -constructing the internal forces curves;  |
|              |             | -sketching the deflected shapes of loaded beams and frames;  |
|              |             | -how to position live loads to maximize the value of a certain type of force at a designated section |
|              |             | of a structure.  |
|              | s           | The structural engineer interacts continuously with other engineers and architects. The structural   |
| 0            | nce         | engineer is responsible for the creation of a structural system in harmony with each of the          |
| Cross        | competences | architectural alternatives, sizing the elements in the structure to determine the feasibility and to |
| 0            | duid        | estimate the construction cost. A large number of structural engineers are engaged in the research   |
|              | ö           | field.   |

| 7. | <b>Discipline objectives</b> | (as results from | the key competences | gained) |
|----|------------------------------|------------------|---------------------|---------|
|----|------------------------------|------------------|---------------------|---------|

|     |                     | Fundamental concepts must be mastered by any student to           |
|-----|---------------------|---|
|     |                     | applying them to the solution of problems through using classical |
|     |                     | method, which focus on specific modes of structural response      |
| 7.1 | General objective   | and behavior, before proceeding with the more general matrix      |
| /.1 | General objective   | methods. Structural analysis teaches the student to determine the |
|     |                     | response of a structure to specified loads and actions, response  |
|     |                     | measured by establishing the forces and deformations throughout   |
|     |                     | the structure.  |
|     |                     | The engineer will be required to make many technical decisions    |
|     | Specific objectives | about structural system: selecting an efficient, economical and   |
| 7.2 |                     | attractive structural form, evaluating its safety (stiffness and  |
|     |                     | strength), and planning its erections under temporary             |
|     |                     | construction loads.   |

#### 8. Contents

| 8.1. L | ecture (syllabus)   | Teaching methods         | Notes |
|--------|---|--------------------------|-------|
| 1.     | Limit states. Ultimate and serviceability limits.             |                          |       |
|        | Characteristic material strengths and Characteristic actions. |                          |       |
|        | Partiak factors of safty. Combinations of actions.            |                          |       |
|        | Analysis of indeterminate structures by the flexibility       |                          |       |
|        | method:concept of a redundant,fundamentals of flexibility     |                          |       |
| 2.     | method. Analysis of indeterminate structures by the           | ( a atura with           |       |
|        | flexibility method:support settlements,temperature change     | Lecture with discussions |       |
|        | and fabrication errors.                                       | discussions              |       |
|        | Analysis of indeterminate structures by the flexibility       |                          |       |
| 3.     | method: analysis of structures with several degrees of        |                          |       |
|        | indeterminacy, beam on elastic supports, practical design.    |                          |       |
| 4.     | Analysis of indeterminate structures by the flexibility       |                          |       |

|        | method:continuous beams with three-moment equation.            |                  |       |
|--------|--|------------------|-------|
|        | Space structures:pin-jointed space frames (space truss         | -                |       |
|        | structures), stability and determinancy, joint equilibrium     |                  |       |
| 5.     |  |                  |       |
|        | equations (matrix method), plane structures loaded normal      |                  |       |
|        | to their plane.  |                  |       |
| ~      | Analysis of indeterminate beams and frames by the slope-       |                  |       |
| 6.     | deflection equations:kinematic indeterminacy,derivation of     |                  |       |
|        | the slope-deflection equations, use of symmetry.               | -                |       |
| 7.     | Analysis of structures without sidesway and analysis of        |                  |       |
|        | structures that are free to sidesway.                          | -                |       |
| 8.     | Moment Distribution:Hardy Cross procedure,development          |                  |       |
|        | of the M.D. method, frames with no joint translation.          |                  |       |
|        | Moment Distribution: frames with side sway, support            |                  |       |
| 9.     | settlements, fabrication errors and temperature                |                  |       |
|        | change(linear and nonlinear).                                  |                  |       |
|        | Influence lines for indeterminate structures:construction of   |                  |       |
|        | influence lines using moment distribution, Muller-Breslau      |                  |       |
| 10.    | principle, qualitative influence lines for beams and           |                  |       |
|        | frames, influence lines for continuous beams, live load        |                  |       |
|        | patterns to maximize forces in multistory buildings.           |                  |       |
|        | Approximate analysis of indeterminate structures:guessing      |                  |       |
| 11.    | the location of inflection point, estimating deflections of    |                  |       |
|        | trusses.   |                  |       |
|        | Approximate analysis of indeterminate                          |                  |       |
| 12.    | structures:approximate analysis of a multistory rigid frame    |                  |       |
| 12.    | for given loads, analysis of unbraced frames for lateral loads |                  |       |
|        | by portal and cantilever method.                               |                  |       |
|        | Plastic analysis:moment-rotation characteristics of general    |                  |       |
| 13.    | cross section, plastic hinge, plastic moment, effect of axial  |                  |       |
|        | force on the plastic moment capacity.                          |                  |       |
| 14.    | Matrix structural analysis-truss structures                    |                  |       |
| 8.2. A | Applications/Seminars  | Teaching methods | Notes |
| 1      | Flexibility method applied to a frame statically               |                  |       |
| 1.     | indeterminate of degree one:internal forces curves.            |                  |       |
|        | Flexibility method applied to a frame statically               | 1                |       |
| 2.     | indeterminate of degree two:internal forces curves.            |                  |       |
|        | Flexibility method applied to a frame statically               | 1                |       |
|        | indeterminate of degree one, loaded with support               |                  |       |
| 3.     | settlement,temperature change and fabrication error,internal   | Problems solving |       |
|        | forces curves.   | with discussions |       |
| 4.     | Continuous beams solved with the three-moment equation.        |                  |       |
|        | Slope-deflection method: frames without sidesway(frame         |                  |       |
| 5.     | with one joint), internal forces curves.                       |                  |       |
|        | Slope-deflection method:frames without sidesway(frame          | 1                |       |
| 6.     | with two joints), internal forces curves.                      |                  |       |
| 7.     | Slope-deflection method:frames with sidesway.                  | 1                |       |
| /•     | stope deficed on method. numes with sidesway.                  |                  |       |

| 0      | Slope-deflection method:frames without sidesway solved        |
|--------|---|

# 9. Bridging course contents with the expectations of the representatives of the community, professional associations and employers in the field

Acquired skills will be needed for civil engineers who work in design and buildings firms, and are fundamental for those who will follow master and doctoral programmes in the field of Civil Engineering.

#### **10.** Evaluation

| Activity type  | 10.1 Assessment criteria             | 10.2 Assessment methods | 10.3 Weight in the final grade |  |  |  |  |
|--|--------------------------------------|-------------------------|--------------------------------|--|--|--|--|
| Course   | 2 theory subjects                    | Written examination     | 40%                            |  |  |  |  |
| Applications   | 3 problems                           | Written examination     | 60%                            |  |  |  |  |
| 10.4 Minimun   | 10.4 Minimum standard of performance |                         |                                |  |  |  |  |
| The minimum average mark of the two theory subjects is 5 (five). |                                      |                         |                                |  |  |  |  |

Attendance at laboratory works, solving and submitting homework is mandatory under the provisions of ECTS Regulation.

Date of filling in October, 10-2019

Teachers in charge of seminars Asist.ing.Moldovan Ilinca Prof. dr. ing. Mircea Petrina Head of department Prof. dr. ing. Cosmin Chiorean
